## Customer Reviews

I would recommend this book for anyone who is serious about tidepooling or teaching any sort of marine biology in the northeast. The dichotomous key is tricky to wrap your head around at first but once you get it, this will be invaluable. This was a required text for my undergraduate marine biology course and I have since purchased another copy to teaching use. 100% recommend this.

Leland W. Pollock's *A Practical Guide to the Marine Animals of Northeastern North America* is what I have been searching for ever since getting into inverts. For the region, I have been using Kenneth L. Gosner's *Guide to Identification of Marine and Estuarine Invertebrates--Cape Hatteras to the Bay of Fundy*, but my copy is very worn, not to mention it is out of print. I have bought two copies after it was out of print, with my last one purchased for much more than the original cover price. And although esthetically pleasing and good for a second, conformational source, books such as Peterson's guides lack the minutia that I need to truly identify an invert to species. Pollock uses a tabular key system which works well with his many illustrations. It's neat that he included animals with spines, because someday I might get into them. This is a good text for an individual who wants to identify more than just shells that have been washed up onto the beach. I recommend this book.

The product was advertised as "very good" condition. I would rate it as "good." Picky, picky, I know. In any event, it was delivered quickly, and the inside was in good shape.

Great book, super detailed, a little hard to navigate but once you figure it out the book is very accurate.

Book came a little scuffed...
